## WHAT IS CLAIMED IS:

1. An embolectomy catheter for removing a blood clot or other such obstructive matter from a blood vessel, the catheter comprising:

an elongate flexible catheter body having a proximal end, a distal end, an inner tube, and a guidewire lumen a part of which extends longitudinally through the inner tube, the guidewire lumen being sized to receive a guidewire therein and being open on its distal end to permit the guidewire so received to project distally from the distal end of the catheter body; and

a clot removal device on the inner tube, the clot removal device being deployable in a first state to a radially expanded configuration.

- 2. The catheter of claim 1, further including an outer tube arranged to surround and constrain the clot removal device about the inner tube in a second state prior to its deployment to the first state, the catheter body and clot removal device in the second state being passable through the clot.
- 3. The catheter of claim 2, wherein the inner and outer tubes are relatively axially displaceable to cause the clot removal device to transition between the first and second states.
- 4. The catheter of claim 3, wherein the inner and outer tubes extend coaxially substantially the entire length of an insertion portion of the catheter body.
- 5. The catheter of claim 4, further including a handle attached to a proximal end of the insertion portion, and an actuator on the handle for proximally displacing the outer tube with respect to the inner tube.
- 6. The catheter of claim 5, further including an infusion port provided on the handle in fluid communication with an annular space defined between the inner and outer tubes.
- 7. The catheter of claim 6, wherein the infusion port is mounted to a slide that is axially displaceable on the handle, and wherein the catheter body outer tube is attached to a distal end of the slide to receive fluid from the infusion port.

- 8. The catheter of claim 2, further including a distal tip attached to a distal end of the inner tube, the distal tip having a tapered distal surface defining the distal end of the catheter body, the tapered distal surface facilitating passage of the catheter body through the clot.
- 9. The catheter of claim 8, wherein the distal tip defines a proximal mouth for receiving a short length of the outer tube, wherein the distal end of the outer tube is thereby prevented from catching on the clot as the catheter body passes therethrough.
- 10. The catheter of claim 9, wherein the outer tube is relatively retractable in the proximal direction with respect to the inner tube, the clot removal device radially expanding into the first state in a region between the retracted outer tube and the distal tip.
- 11. The catheter of claim 10, wherein the clot removal device has a proximal end and a distal end, the distal end being attached to the inner tube and the proximal end being free to slide axially over the inner tube, the proximal end of the clot removal device being axially displaced away from the distal end within the outer tube to longitudinally stretch and radially constrict the device in the second state.
- 12. The catheter of claim 11, wherein the clot removal device comprises a plurality of separate wires each attached at their distal ends to the inner tube and being looped about the inner tube at their proximal ends.
- 13. The catheter of claim 11, further including a sliding marker band disposed about the inner tube and configured to slide with the proximal end of the clot removal device to indicate the transition between the first and second states.
- 14. The catheter of claim 13, further including a fixed marker band attached about the inner tube distally with respect to the clot removal device, the relative spacing between the fixed marker band and the sliding marker band indicating the transition between the first and second states.
- 15. The catheter of claim 1, wherein the catheter further comprises a handle and an insertion portion of the catheter body extending distally from handle, the insertion portion being defined by the inner tube and a co-axial outer tube extending

- substantially to the distal end of the catheter body, the clot removal device being radially constricted about the inner tube in a second state prior to its deployment to the first state, the catheter body and clot removal device in the second state being passable through the clot, wherein the inner and outer tubes are relatively axially displaceable to cause the clot removal device to transition between the first and second states.
- 1 16. The catheter of claim 15, wherein the insertion portion becomes more 2 flexible in a distal direction from the handle.
  - 17. The catheter of claim 16, wherein the catheter body has a size of between about 1-5 French at its distal end.

- 18. The catheter of claim 16, wherein both the inner and outer tubes become more flexible in a distal direction from the handle.
- 19. The catheter of claim 18, wherein both the inner and outer tubes include discrete segments that become more flexible in a distal direction from the handle.
- 20. The catheter of claim 19, wherein at least one of the inner and outer tubes includes a reinforced segment adjacent the handle.
- 21. The catheter of claim 15, further including an actuator on the handle for proximally displacing the outer tube with respect to the inner tube.
- 22. The catheter of claim 21, further including an infusion port provided on the handle in fluid communication with an annular space defined between the inner and outer tubes.
- 23. The catheter of claim 22, wherein the infusion port is mounted to a slide that is axially displaceable on the handle.
- 24. The catheter of claim 23, further including an inner hypotube extending substantially the length of the handle and attached at its distal end to the catheter body inner tube, and a guidewire introducer on a proximal end of the handle leading to the lumen of the inner hypotube, wherein the slide includes a throughbore receiving the hypotube.
- 25. The catheter of claim 24, wherein the infusion port is in fluid communication with the throughbore, and wherein the catheter body outer tube is

attached to a distal end of the slide co-axially with respect to the throughbore for receiving fluid from the infusion port.

- 26. The catheter of claim 1, wherein the clot removal device has a proximal end and a distal end, the distal end being attached to the inner tube and the proximal end being free to slide axially over the inner tube, the proximal end of the clot removal device being axially displaced away from the distal end within the outer tube to longitudinally stretch and radially constrict the device in a second state prior to its deployment to the first state, the clot removal device in the second state being passable through the clot.
- 27. The catheter of claim 26, further including a sliding marker band disposed about the inner tube and configured to slide with the proximal end of the clot removal device to indicate the transition between the first and second states.
- 28. The catheter of claim 27, further including a fixed marker band attached about the inner tube distally with respect to the clot removal device, the relative spacing between the fixed marker band and the sliding marker band indicating the transition between the first and second states.
- 29. The catheter of claim 26, wherein the clot removal device comprises a plurality of separate wires each attached at their distal ends to the inner tube and being looped about the inner tube at their proximal ends, the wires being spring biased to radially expand if unconstrained, the catheter body further including an outer tube arranged to surround and constrain the clot removal device about the inner tube in the second state, the inner and outer tubes being relatively axially displaceable to release the wires.
- 30. The catheter of claim 29, wherein the separate wires are helically wound about the inner tube, the spring-biased helical wires forming a radially expanded nest configuration upon their release from within the outer tube.
- 31. A system including the catheter of claim 1, and further including a guidewire received in the guidewire lumen and having a length sufficient to extend from the proximal end of the catheter body and project from the distal end.
  - 32. The system of claim 31, wherein the guidewire is an infusion guidewire.

33. An embolectomy catheter for removing a blood clot or other such obstructive matter from a blood vessel, the catheter comprising:

an elongate flexible catheter body having a proximal end, a distal end, an inner tube, and an outer tube terminating just short of a distal end of the catheter body;

a clot removal device on the inner tube, the clot removal device being initially collapsed and constrained in its collapsed configuration by a portion of the outer tube;

a distal tip of the catheter body located on the inner tube and adapted to pass through a blood clot to be removed; and

wherein the outer tube is axially retractable to remove the constraint on the clot removal device such that the clot removal device may radially expand to a deployed configuration.

- 34. The catheter of claim 33, wherein the outer tube extends distally within a proximal mouth of the distal tip prior to being retracted.
- 35. The catheter of claim 33, wherein the inner tube is reinforced along its entire length.
- 36. The catheter of claim 35, wherein the inner tube is more flexible at its distal end than at its proximal end.
- 37. The catheter of claim 36, wherein the inner tube includes a proximal reinforced segment and a distal reinforced segment, and wherein the proximal segment has reinforcement of higher density than in the distal segment.
- 38. The catheter of claim 33, wherein the catheter body becomes more flexible in a direction from the proximal end to the distal end.
- 39. The catheter of claim 38, wherein the catheter body has a size of between about 1-5 French at its distal end.
- 1 40. The catheter of claim 38, wherein both the inner and outer tubes include 2 discrete segments that become more flexible in a direction from the proximal end to the 3 distal end.

41. The catheter of claim 40, wherein the inner tube is reinforced along its entire length, and includes a proximal reinforced segment and a distal reinforced segment, and wherein the proximal segment has reinforcement of higher density than in the distal segment.

- 42. The catheter of claim 38, wherein a portion of the outer tube that constrains the clot removal device in its collapsed configuration has a substantially lower column strength than a portion of the inner tube about which the clot removal device is mounted.
- 43. The catheter of claim 33, further including a handle attached to a proximal end of the insertion portion, and an actuator on the handle for proximally displacing the outer tube with respect to the inner tube.
- 44. The catheter of claim 43, further including an infusion port provided on the handle in fluid communication with an annular space defined between the inner and outer tubes.
- 45. The catheter of claim 44, wherein the infusion port is mounted to a slide that is axially displaceable on the handle.
- 46. The catheter of claim 43, further including a slide that is axially displaceable on the handle and an inner hypotube extending substantially the length of the handle and attached at its distal end to the catheter body inner tube, and a guidewire introducer on a proximal end of the handle leading to the lumen of the inner hypotube, wherein the slide includes a throughbore receiving the hypotube.
- 47. The catheter of claim 33, wherein the clot removal device has a proximal end and a distal end, the distal end being attached to the inner tube and the proximal end being free to slide axially over the inner tube, the proximal end of the clot removal device being axially displaced away from the distal end within the outer tube to longitudinally stretch and radially constrict the device in a second state prior to its deployment to the first state, the clot removal device in the second state being passable through the clot.

48. The catheter of claim 47, further including a sliding marker band disposed about the inner tube and configured to slide with the proximal end of the clot removal device to indicate the transition between the first and second states.

- 49. A system including the catheter of claim 33, wherein the inner tube defines a guidewire lumen sized to receive a guidewire therein, the guidewire lumen being open on its distal end to permit the guidewire so received to project distally from the distal end of the catheter body, and further including a guidewire received in the guidewire lumen and having a length sufficient to extend from the proximal end of the catheter body and project from the distal end.
  - 50. The system of claim 49, wherein the guidewire is an infusion guidewire.
